Internet Gateways,
Load Balancer

Functions of the LP-LB404 Quad Wan Load Balancer Router & Firewall

Dear clients,

Please download this file at the following link:

http://www.lanpro.com/documents/en/active/LPLB404_M123_ENB01W.pdf

That file is the fast configuration guide of a very interesting and seldom noticed product: the **LP-LB404 Load Balancer**.

What function does it perform?

You can feed the **LP-LB404** with up to 4 WAN ISP service channels and the result is that your users will think all these ISP services merge into one high capacity stream with 2 or 3 WAN ISP inputs working simultaneously.

Simple to use, this device is not as complex to work with, providing quad-bandwidth and support of Load Balancing and a redundancy function that backs-up connections automatically for each other channel resulting in continuity of the Internet service.

Many businesses or institutions, commonly in South America have 2 or more ISP's in order to have continuity of service. Very useful in hotel,

hospital, military, airport places that require high availability of Internet service. Its basic configuration is simple, and offers many complex options that users with demanding needs can implement.

The **LP-LB404** eliminates the hassle that a Server would require for implementing this same function and besides being 100% firmware proprietary, it is practically hacker-free; and even more: you don't need a server for it to work, it manages all the multiple Internet services in the most efficient way.

Please don't hesitate to call if you are interested in this extraordinary product.

Kind regards to all...

Your **LanPro** sales Team at: sales@lanpro.com
